RAGHAVA MANDALAPU

Python Full Stack Developer

Phone: 972.383.9611 | Email: raghava.m1001@gmail.com | Linkedin | Github | MyWebsite |

Professional Summary:

Full Stack Developer experienced in designing and delivering scalable applications using Python, FastAPI, React.js, Angular, AWS, Azure and GCP. Skilled in building secure APIs, developing cloud-native backend services, and creating intuitive user interfaces. Experienced in CI/CD automation, AI-powered document processing, and unit and integration testing. Collaborates across teams to deliver reliable production-ready solutions in Agile environments.

Technical Skills:

Programming Languages: Python, TypeScript, JavaScript, HTML, CSS, SQL
Frameworks: Node.js, React.js, Angular 18, FastAPI, Flask, Django, Chakra UI, SQLAlchemy
Backend & APIs: REST APIs, GraphQL (Ariadne), Middleware, Microservices, Event-driven Architecture
Cloud Platforms: AWS (ECS, ECR, S3, IAM, Lambda, CloudWatch), Azure (Blob Storage, Key Vault, Cosmos DB, Functions), GCP (Cloud Storage), ETL/ELT Pipelines, Workflow Orchestration (Airflow)
DevOps & CI/CD: Docker, Kubernetes, Terraform, GitLab CI/CD, Azure DevOps, Jenkins, Brazil-build, Hydra Tests
Authentication & Security: OIDC, SSO, AWS IAM, Azure Key Vault, RBAC, Token-based Authentication
ML/AI & Automation: OpenAI API, Azure OpenAI, Intelligent Document Processing, LLM Tagging, Selenium Automation, AI-powered Search, scikit-learn, Pandas, PySpark, ML Fundamentals (Regression, Clustering, ANOVA)
Testing & QA: PyTest, Selenium WebDriver, Postman, Unit & Integration Testing, TDD
Collaboration: Agile/Scrum, Jira, Sprint Planning & Demos, Documentation, Knowledge Transfer, Mentorship

Professional Experience:

Client: Christus Health **May 2025 – Present**
Role: Python Full Stack Developer
Project: Healthcare Contract Intelligence & Sales Enablement Platform

- Developed scalable Python/FastAPI microservices to ingest and process contracts, customer, product, invoices, and metadata across enterprise healthcare workflows.
- Built AI-powered document processing to extract and tag key information from unstructured PDFs, reducing manual data-entry efforts.
- Developed compliance and financial-impact modules to compare transactional data against contract pricing, volume, and performance commitments and identify potential violations.
- Built automated processing workflows using Azure Functions, Cosmos DB, and Redis caching, improving application performance and data-processing efficiency.
- Developed responsive Angular and TypeScript dashboards with reusable components to display contract status, compliance results, and AI-extracted information.
- Designed REST APIs and Tableau integrations to provide business stakeholders with visibility into compliance, customer performance, and financial-impact metrics.
- Developed a centralized sales enablement portal using FastAPI, Angular, and TypeScript, integrating external content platforms with search, tagging, and caching.
- Implemented secure SSO authentication and containerized applications using Docker for reliable enterprise deployments.
- Deployed applications to AWS ECS/Fargate using ECR, IAM, and CloudWatch, supporting scalable hosting, security, and application monitoring.
- Automated testing and deployments using PyTest, CI/CD, and Terraform, supporting reliable releases across environments.

Client: Pilgrim Bank **Oct 2024 – May 2025**
Role: Python Full Stack Developer
Project: Credit Risk Exposure & Regulatory Analytics Platform

- Built Python-based backend services with FastAPI and Django to aggregate and manage credit exposure data across enterprise risk-management workflows.
- Designed RESTful APIs and microservices to automate regulatory calculations and data exchanges supporting IFRS, Basel, CCAR/RWA, and SCCL requirements.
- Developed scheduled Apache Airflow workflows for ingesting, validating, transforming, and processing large volumes of financial and credit-risk data.
- Designed data-access layers using PostgreSQL and SQLAlchemy, optimizing complex queries and improving performance for high-volume exposure calculations.
- Developed React.js and TypeScript dashboards with reusable components to visualize credit exposure, regulatory metrics, and risk analytics for business users.
- Integrated Google Cloud Storage for secure file handling and supported Python-based data-processing workflows for credit-risk reporting.
- Containerized backend services with Docker and supported automated deployments using Jenkins and Kubernetes, improving consistency across application environments.
- Developed automated unit, integration, and API testing using PyTest, Mocha, and Chai to improve application stability and maintain strong test coverage.
- Worked closely with risk analysts, business teams, and product owners to convert regulatory and credit-risk requirements into scalable technical solutions.
- Participated in Agile/Scrum delivery, including Jira story refinement, sprint planning, code reviews, testing, and production-release support.

Client: AT&T **Jan 2023 – Oct 2024**
Role: Python Full Stack Developer
Project: Telecom Customer Management & Service Analytics Platform

- Developed RESTful microservices using Python and FastAPI to manage telecom customer accounts, service requests, and account updates, supporting integrations with internal applications.
- Designed and integrated REST APIs to exchange customer, billing, and service information between internal applications.
- Built responsive customer management dashboards using React.js and TypeScript, creating reusable UI components for account details, service requests, and operational reporting.
- Implemented backend validation and business logic for service activation, account updates, and order-status tracking.
- Used PostgreSQL and SQLAlchemy to manage telecom customer records, optimize queries, and support reporting workflows.
- Developed Azure Functions workflows for asynchronous processing of telecom service events and integrations with third-party systems.
- Implemented authentication and role-based access controls to protect customer and operational information.
- Containerized backend services using Docker and supported automated builds, testing, and deployments through Azure DevOps CI/CD pipelines.
- Wrote unit and API tests using PyTest and Postman, and resolved defects during integration and release cycles.
- Collaborated with business analysts, QA engineers, and product owners in Agile sprints to deliver customer-facing features.

Client : DOTLABS **June 2019 – Nov 2021**
Role : Software Developer
Project : Digital Product Development & Web Solutions Platform

- Developed responsive web applications using JavaScript, React.js, HTML, and CSS for customer-facing digital products.
- Built and integrated RESTful APIs to support communication between frontend applications and backend services.
- Developed reusable React components and implemented responsive interfaces based on business and UI requirements.
- Implemented backend functionality using Python and Node.js to support application workflows and data processing.
- Worked with PostgreSQL and MySQL to develop queries, manage application data, and improve database performance.
- Integrated third-party APIs and external services to extend application functionality and streamline business workflows.
- Used Git for source control, code collaboration, feature branching, and maintaining application releases.
- Performed unit testing, API testing, debugging, and defect resolution to improve application stability.
- Supported application deployment and production releases using AWS and CI/CD practices.
- Collaborated with developers, designers, QA, and product teams in an Agile/Scrum environment to deliver production-ready features.

Education:

Master's in computer & information science
Southern Arkansas University – Magnolia, Arkansas
